USDC-backed protection for EURC and cirBTC

Built on Arc testnet

A fixed USDC claim, funded reserves and a choice of exits.

Circle USDC powers the claim, reserve and gas

arc.yieldshield.ai

$16,000

Grant request

$11,000 core work
$5,000 conditional mainnet release

A choice for holders, a risk for providers

Asset holders

Keep EUR or BTC exposure while setting a fixed exit value in USDC.

Conventional hedges can need active pricing and specialist execution.

Capital providers

Commit USDC reserves to earn fees on realized gains.

Receive the surrendered asset and bear its downside risk.

First audience Arc treasury, lending, wallet and agent builders in a controlled testnet pilot.

The protection lifecycle

At entry

The oracle fixes the USDC claim. Providers reserve 150% of that amount.

Keep the asset

Pay 12% of realized gain only.
10% goes to providers, 1% to the creator and 1% to the protocol.

Take the USDC claim

Surrender the asset for the fixed claim.
Providers receive the asset and bear its loss.

At maturity, anyone may settle. Remaining assets go to providers and holders claim USDC.

Circle integrations

USDC

Reserves and claims
6-decimal ERC-20 accounting
Gas on Arc

EURC + cirBTC

Canonical Circle testnet assets
EURC has 6 decimals. cirBTC has 8.
Chronicle prices EURC/USD against USDC/USD and CIRBTC/USDC.

Grant work

App Kit Bridge exits to Ethereum Sepolia and Base Sepolia for both USDC and EURC. MCP tools prepare unsigned transactions.

A working testnet foundation

3 markets

EURC, cirBTC and a clearly labeled scenario market

8 deployment txs

Runtime code checked against our build, plus asset identities, wiring, terms, seeds and receipts.

A separate scripted-wallet journey exercised provision, protection, both exits and redemption.

Current limits

Testnet only. No users or revenue. No browser-wallet signing claimed. Deployment checks and 72 Foundry tests are not an audit.

A measurable testnet pilot

Recruit

Invite 20 treasury, lending and agent builders through developer communities and our network.
Conduct five interviews.

10 testers

Own wallets and faucet tokens.
30 completed journeys covering both exits, provider claims and maturity settlement.

Measure

8 of 10 complete a core flow without live help.
Seek two follow-on integration expressions of interest.

Future targets. No users or commitments yet. Publish results and fixes. Protocol revenue model: 1% of realized gain.

Self-funded. No grants or investment received. Founders own the work and review AI-assisted development.

$16,000 across four milestones

Deliverable	Acceptance / target	Hours	Budget
CCTP + App Kit exits	4 routes, receipts + recovery Week 3	35	$3,500
MCP + agent identity	Unsigned tools + wallet session Week 6	45	$4,500
Pilot + hardening	10 testers, 30 journeys Week 9	30	$3,000
Capped mainnet release	After audit + legal review	50	$5,000

$11,000 core work. The $5,000 mainnet milestone needs a separately funded audit and legal review. Existing work is not billed.
